To: Mystery Startup Stakeholders
Re: Spoiled Tomatillos Project Report

As we near the end of our estimated time to version 1.0, it is good to check that we are on track for that release. To do this, we will use two different metrics. The first is the number of use cases from our Use Cases document that we have completed, and the second is the issues logged in Jira, both created by us.

For the first metric, we have completed 11 out of our original 24 use cases. Along the way in the sprints so far, we discovered a number of other use cases that we needed to implement, and have mostly done so, as those use cases were found as necessary items.

For the second metric, you can see the graph below. You can see a large flat section where the entire development team took a week off, and you can generally see steps around that as we made progress in the sprints. There is still a large number of issues marked as To Do, but we believe this is symptomatic of the team not being used to Jira, and how to close issues. Smart commits help with this, but the team will be going through Jira at the conclusion of the current sprint, and checking that all issues are updated appropriately.
